

# Cadrage, reworked

From settings linter to camera school · August 2026  
2026-08

## The site did not match its owner's view

- Three routes shipped saying Not built yet
- 26 review rules cited 13 missing lessons
- Camera view covered a movie-mode subset
- Nav ordered around the tool, not the learning

Replicate the UI from the Sony a6700 to assist the full walkthrough of the camera menu.

— The brief, spelling normalised

# Agenda

1. Learn
2. Walkthrough
3. The camera

# Learn

Basics before advanced, six tracks

## Every claim in the curriculum names its source

- 24 lessons, six tracks, three levels
- Exposure triangle and focus, basics to advanced
- Colour, light, format built from the rules' data
- Each lesson links camera rows and calculators
- Every rule's Read-why now lands somewhere

# The Learn index

 **Cadrage**  
What each setting does, and why it matters

How it judges

[Learn](#)[Walkthrough](#)[Camera](#)[Review](#)[Calculators](#)

### Learn

Basics before advanced, in the order the decisions actually depend on each other. 24 lessons, 0 read. Every camera claim carries the same provenance chip the review uses.

### The exposure triangle

Aperture, shutter and ISO trade in the same unit. What each one buys, what it costs, and who holds which side.

**BASICS**

#### The exposure triangle

Aperture, shutter speed and ISO each buy light with a different currency. One stop is the unit they all trade in.

**BASICS**

#### Aperture, and what it costs

The f-number sets light and depth of field at once. Wide open is bright and thin; stopped down is dim and deep.

**BASICS**

#### Shutter speed, stills and video

For stills it is about freezing or blurring motion. For video it is about the look, and about not banding under mains light.

**BASICS**

#### P, A, S, M and what each one gives away

The mode dial decides which side of the triangle you hold and which the camera is free to move.

**INTERMEDIATE**

#### ISO, gain and where the noise comes from

ISO is amplification, not sensitivity. Auto ISO in a take moves the exposure while you are not looking.

**INTERMEDIATE**

#### Metering, compensation, and what the meter is for

The meter suggests; zebras and the histogram tell the truth. Compensation moves the suggestion, not the truth.

**ADVANCED**

#### Equivalence, ND and holding exposure across a shoot

Once the triangle is a habit, the interesting problems are holding exposure constant when something outside the camera changes.

### Focus

When the camera may move focus, where it may look, and the movie-only rows that tune how it behaves.

**BASICS**

#### The focus of the lens

**BASICS**

#### Focus breathing

**INTERMEDIATE**

#### Focus shift with autofocus

**INTERMEDIATE**

#### Shutter lag and mirror slap

# Walkthrough

The camera, in dependency order

# Video writes, photo teaches

## Video, 13 steps

- Format, exposure, colour, focus, check
- Apply writes into the live setup
- Flicker-clean shutter computed per config

## Photo, 11 steps

- Points at rows and explains
- Never writes: the setup models video
- Same lessons, same camera rows

# The video pass

 **Cadrage**  
The camera, in the order decisions depend on each other

How it judges

[Learn](#) [Walkthrough](#) [Camera](#) [Review](#) [Calculators](#)

[Walkthrough](#) / [Video](#)

### Video walkthrough

The pass to run before a controlled video shoot. Every step can write the value it argues for into the active setup, and the Review re-judges as you go. Progress: 0 of 13.

---

### Format

1 **Pick the container** **File Format**

XAVC HS is HEVC: every mode is 10-bit and the files are smaller for the same quality, but they are heavier to decode on the edit machine. XAVC S is AVC: bigger files, plays everywhere, and its 4K list mixes 8-bit and 10-bit rows. If the edit is CapCut or an older machine, S is the safe answer; if the pipeline handles HEVC, HS gets you 10-bit at lower bitrates.

[Show on the camera](#) [Read why](#) [Calculator](#) [Mark done](#)

2 **Set the frame rate** **Rec Frame Rate**

24p is the film look, 60p is the smooth look and the one that survives slowing down in the edit. The camera only offers the rates the chosen container supports, exactly as the body does, and 24p exists only on NTSC per Sony's own footnote. Displayed rates are rounded: 24 records 23.98, 60 records 59.94. Decide here, because the shutter step reads this.

3 **Pick bitrate and chroma** **Record Setting**

# The camera

The a6700 menu, transcribed

## The replica comes from the help guide, not memory

- 10-agent research pass over the official guide
- 8 tabs, 280 rows, verified screen layout
- Main is a tile grid, as the body draws it
- Arrows move, Enter descends, Escape is MENU
- Live rows edit the setup; the rest say so

# Movie Main

Cadrage

## The transcription judged the site itself

- Embed LUT File: not on this body. Was Sony spec
- Rule downgraded to unverified, ships off
- Shutter Speed exists only as a Main tile
- Var. Shutter nests inside Anti-flicker Set.

## Nav in the headbar: reviewed, and rejected

- Header actions collapse into the mobile overflow
- Three of five sections would hide behind a tap
- Rail became the headbar's second row instead
- Fixed: rail slid under the bar on scroll
- Fixed: patches wrote to a detached node

## Held by tests, not by memory

|                               |                       |                           |                     |
|-------------------------------|-----------------------|---------------------------|---------------------|
| 1,143                         | 280                   | 24                        | +4,058              |
| Content assertions, all green | Menu rows transcribed | Lessons across six tracks | Lines over 38 files |

## What it cost

- Two data layers to keep aligned: tree and registry
- Tab colours approximated; guide art is grayscale
- Engine still models video only
- rules.js stays past the 500-line guideline

## Still open

- [ ] Publish: repo, Pages, DNS (docs/operations/publishing.md, end to end)
- [ ] OG image and hub card (Hub card stays Soon until the site serves)
- [ ] Registry description update (Source script has other sessions' pending edits)
- [!] Fn menu defaults (Sony documents no factory defaults; needs a real body)
- [ ] Stills in the setup object (Deferred by design; photo track teaches without it)

# One word ships it

→ Say publish, and the runbook runs
